

PROJECT DEVELOPMENT PHASE

Project Title: STREAMLINING IT PROCUREMENT – AUTOMATING STANDARD LAPTOP PROCUREMENT

1. Introduction

The Project Development Phase is the stage where the actual project is developed based on the requirements and design prepared in the previous phases. In this phase, the development team implements the required features, creates the necessary workflows, and integrates the components to build a functional solution. For our project, "Streamlining IT Procurement – Automating Standard Laptop Procurement," the development phase focuses on creating a structured and automated process for standard laptop procurement. The system is designed to simplify laptop requests, improve approval workflows, and reduce manual work in the procurement process.

2. Purpose of the Development Phase

The main purpose of the Project Development Phase is to convert the project design and requirements into a working solution.

The objectives are:

- To develop an automated standard laptop procurement process.
- To implement the required procurement workflows.
- To reduce manual effort and processing time.
- To improve the accuracy and consistency of procurement requests.
- To integrate the required components and prepare the project for testing.

3. Development Activities

3.1 Workflow Development

The procurement workflow is developed to manage the laptop request and approval process. It helps organize the different stages of procurement, from submitting a request to processing the approval.

3.2 Request Management

The system is designed to handle standard laptop procurement requests. Users can submit the required information, and the request can be processed according to the defined workflow.

3.3 Approval Process

An approval mechanism is developed to ensure that laptop requests are reviewed and approved by the appropriate authority before further processing.

3.4 Automation

Automation is implemented to reduce repetitive manual tasks. The workflow helps route requests, manage approvals, and provide consistent processing.

3.5 System Integration

The required components of the project are connected to ensure that the procurement workflow operates as a complete process.

3.6 Error Handling

The development process considers possible errors in request processing and workflow execution. Appropriate checks are planned to improve the reliability of the system.

4. Tools and Technologies

The tools and technologies used in the development phase depend on the project implementation environment.

- ServiceNow Platform
- Flow Designer / Workflow Automation
- ServiceNow Tables and Records
- GitHub for Project Repository and Documentation
- Web Browser for Accessing the Platform

5. Development Process

The development process follows a structured sequence:

1. Review the project requirements and design.
2. Configure the required development environment.
3. Create or configure the required tables, fields, and records.

4. Develop the standard laptop procurement workflow.
5. Implement request submission and approval processes.
6. Configure automation and workflow activities.
7. Integrate the required components.
8. Review the developed solution and resolve errors.
9. Prepare the completed development work for the testing phase.

6. Expected Output

The expected output of the Project Development Phase is a functional procurement workflow that supports standard laptop requests and approval processing. The developed solution should provide a structured laptop procurement request process.

- An automated workflow for request processing.
- An approval mechanism.
- Reduced manual effort in procurement activities.
- A solution ready for the Project Testing Phase.

7. Conclusion

The Project Development Phase is an important stage in developing the "Streamlining IT Procurement – Automating Standard Laptop Procurement" project. During this phase, the project requirements and design are converted into a functional workflow-based solution. The development activities focus on automation, request management, and approval processing. After completing this phase, the project is prepared for testing to verify its functionality and performance.
