1. Introduction

- The main purpose is to automate the process of requesting, approving, and fulfilling standard laptop orders in Service Now. Instead of handling requests manually through emails or messages, ServiceNow can manage the complete process using Service Catalog and Flow Designer.

Service Catalog is the starting point for the laptop request.

Employees can open the Service Catalog and select a laptop-related service.

Example:

- Standard Laptop Request
- Laptop Model
- Employee Name
- Department

- Required Date
- Business Justification
- The employee submits the request through the catalog.

2.Catalog Item:

A Catalog Item is created specifically for the laptop request.

Example Catalog Item:

- Standard Laptop Request
- The form can contain:
- Requested For
- Laptop Type
- Department
- Location
- Required Date
- Reason for Request

This makes sure that all required information is collected in a standard format.

3.Flow Designer:

Flow Designer is the main automation tool in this project.

It automatically performs actions after the laptop request is submitted.

A flow can be designed like:

Laptop Request Submitted → Check Request → Manager Approval → Procurement Task → IT Fulfillment → Notification → Close Request

Instead of an employee manually contacting different teams, Flow Designer moves the request through each stage automatically.

4.Approvals:

An Approval step can be added to Flow Designer.

For example:

Employee submits request → Manager receives approval request

The manager can:

- Approve
- Reject

If approved, the flow continues to the procurement/IT team.

If rejected, the flow can stop and notify the employee.

5.Requested Item(RITM):

When the employee submits the Catalog Item, ServiceNow creates a Requested Item (RITM).

- The RITM represents the actual laptop request.

For example:

- RITM0012345 – Standard Laptop Request

The request can be tracked using its RITM number.

6.Catalog Task(SCTASK):

After approval, Flow Designer can automatically create a Catalog Task.

For example:

SCTASK0015678 – Procure and configure standard laptop

This task can be assigned to the IT or procurement team.

The team can update the task when:

- Laptop is ordered
- Laptop is received
- Laptop is configured
- Laptop is ready for the employee

7. Designer Actions:

Flow Designer provides different actions to automate the process.

Common actions for this project include:

- Ask for Approval
- Create Record
- Update Record
- Send Notification
- Create Catalog Task
- Wait for Condition
- If/Else conditions

These actions allow the entire workflow to run automatically.

8.Notifications:

ServiceNow Notifications keep the employee and IT team informed.

For example:

- **Request Submitted:** “Your standard laptop request has been submitted successfully.”
- **Request Approved:** “Your laptop request has been approved.”
- **Request Rejected:** “Your laptop request has been rejected.”
- **Request Completed:** “Your laptop is ready for collection/delivery.”

9.Business Rules

Business Rules can be used for additional server-side automation when required.

For example, a Business Rule could check or update information when a request record is inserted or updated.

However, for the main workflow, Flow Designer should be the primary automation tool.

10.Client Scripts:

Client Scripts can be used to make the catalog form more dynamic.

For example:

- Make a field mandatory.
- Show or hide a field.
- Automatically populate information.
- Validate user input.

Example:

If the user selects “Other Laptop”, an additional justification field can be displayed.

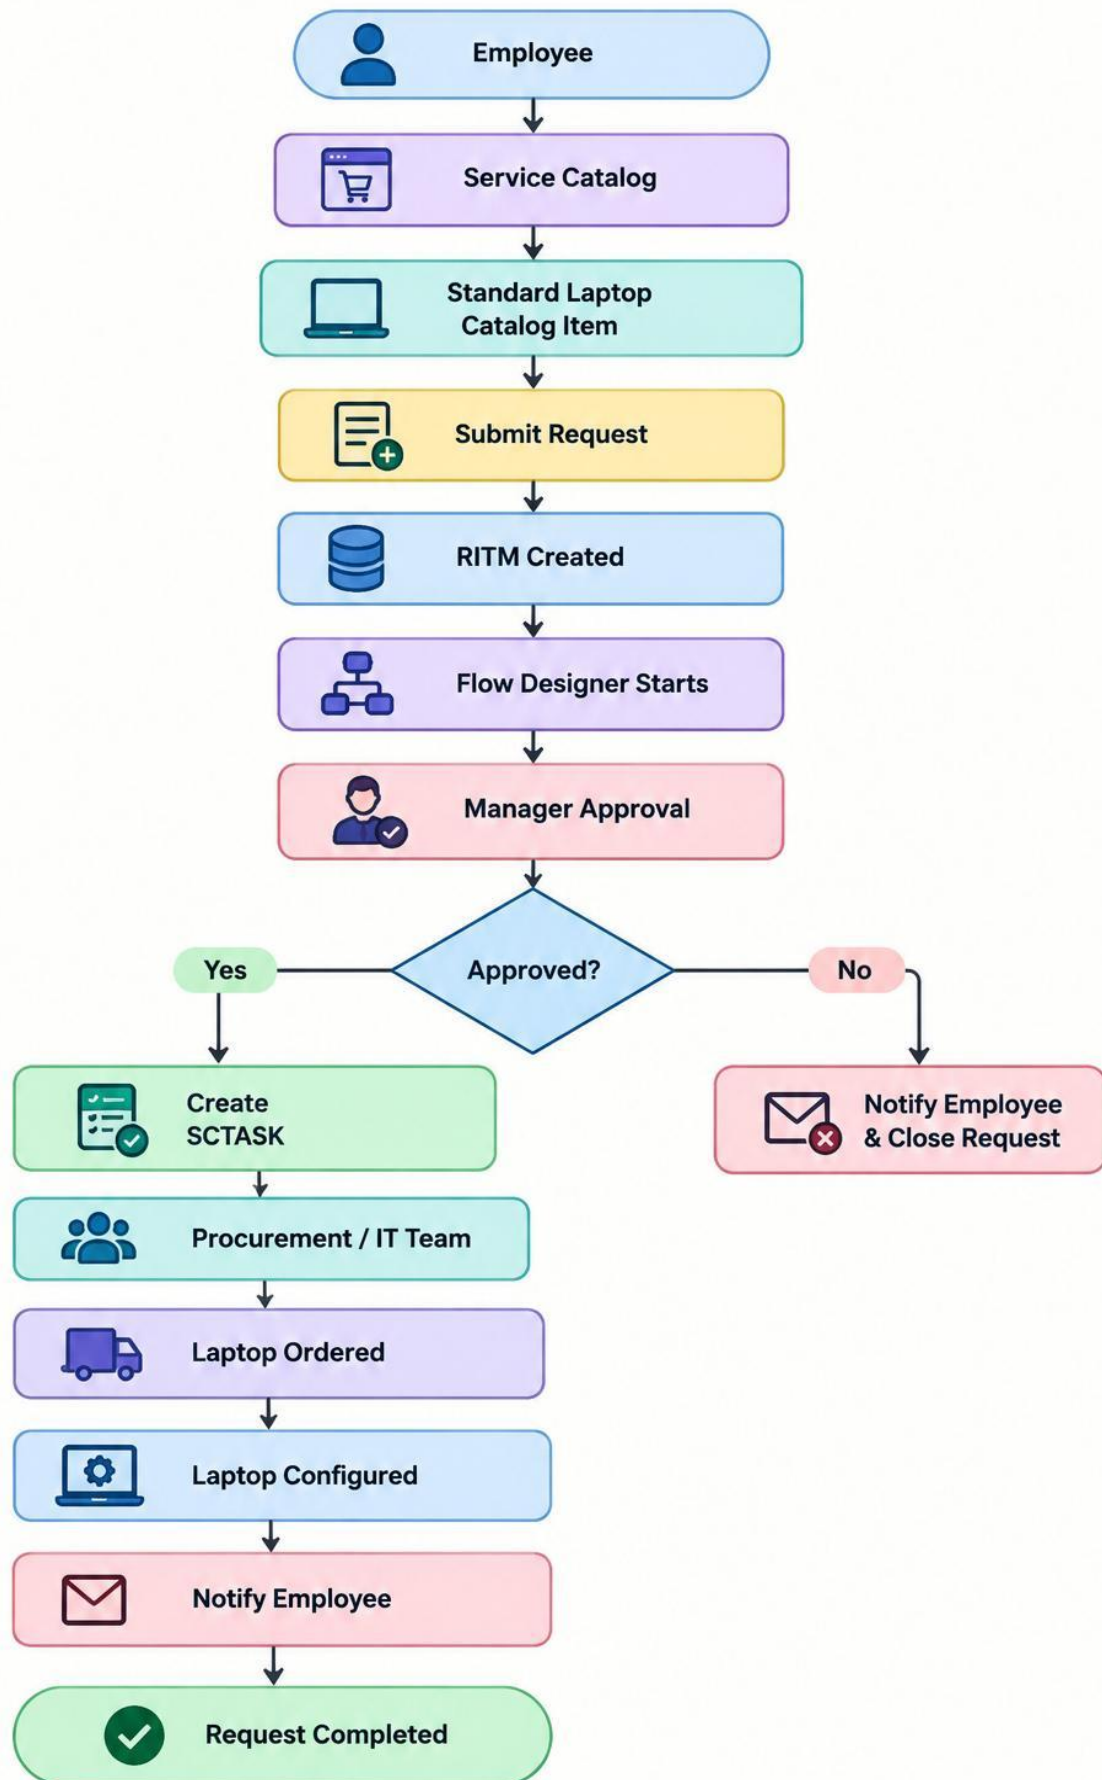

11.Reports and Dashboards:

Reports and dashboards can be created to monitor the procurement process.

- Useful information includes:
- Total laptop requests
- Pending approvals
- Approved requests
- Rejected requests
- Pending procurement tasks
- Completed laptop orders
- Average fulfillment time

This helps the IT department monitor procurement performance.

➤ **Complete Automated Workflow:**

12.Conclusion:

ServiceNow Flow Designer automates the laptop procurement process from request to delivery. It reduces manual work, saves time, improves tracking, and provides a smooth and efficient IT procurement process.
